# Quantitative Flow Ratio (QFR<sup>®</sup>)

**How friendly use FFR ?**  
**Have you ever tested QFR ?**

Luc Maillard, MD, PhD

# Can we improve the capacity of 'luminography' for the detection of ischaemia?

Anatomy: diameter stenosis = 53%

vs.

Physiology: FFR = 0.85

quantitative coronary angiography (QCA)

# Wire based FFR

**FFR** is a quantitative measurement of the functional severity of the coronary stenosis and measured by a pressure wire

$$\text{FFR} = \frac{\text{Distal Coronary Pressure (Pd)}}{\text{Proximal Coronary Pressure (Pa)}}$$

*During maximum hyperemia*

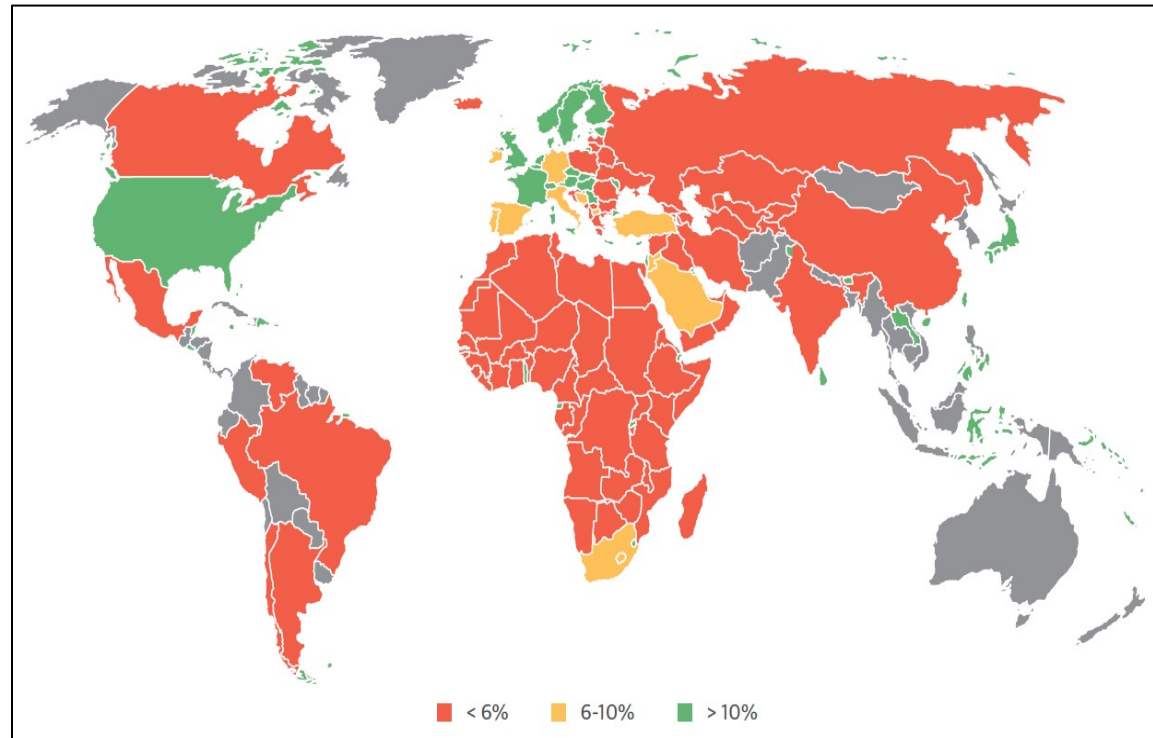

Intervention Yes/No is based on:

$$\text{FFR} \leq \text{ or } > 0.80$$

# Fractional Flow Reserve

Recommendations	Class <sup>a</sup>	Level <sup>b</sup>	Ref. <sup>c</sup>
FFR to identify haemodynamically relevant coronary lesion(s) in stable patients when evidence of ischaemia is not available.	I	A	50,51,713
FFR-guided PCI in patients with multivessel disease.	IIa	B	54
IVUS in selected patients to optimize stent implantation.	IIa	B	702,703,706
IVUS to assess severity and optimize treatment of unprotected left main lesions.	IIa	B	705
IVUS or OCT to assess mechanisms of stent failure.	IIa	C	
OCT in selected patients to optimize stent implantation.	IIb	C	

European Heart Journal, October 2014

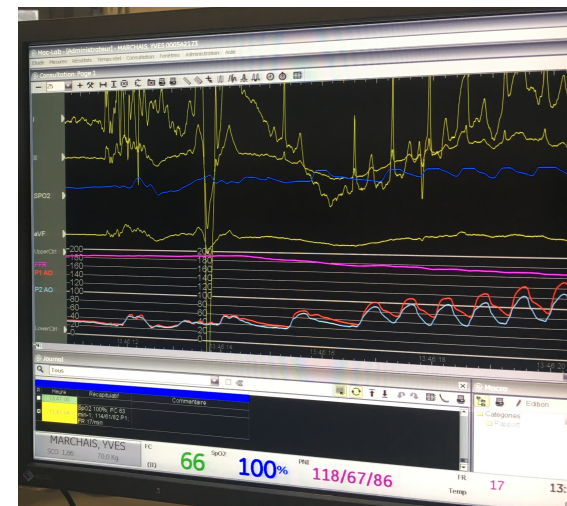

Götberg et al., JACC 2017

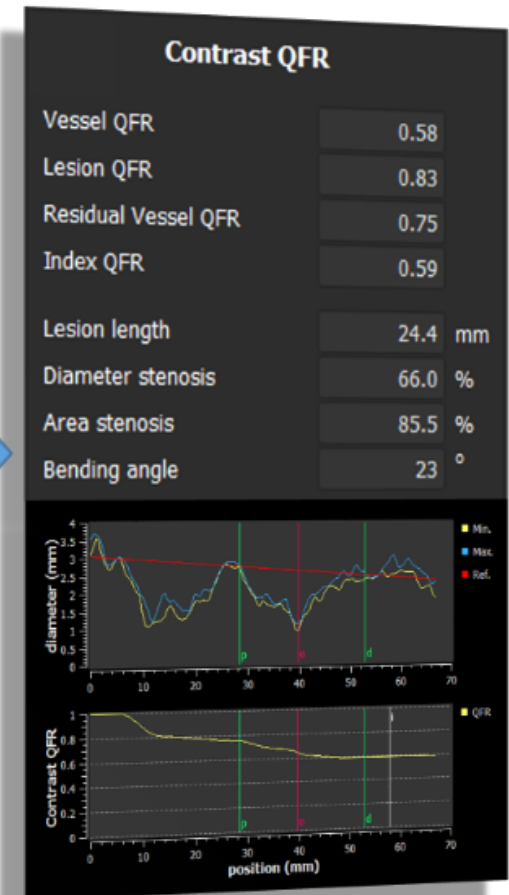

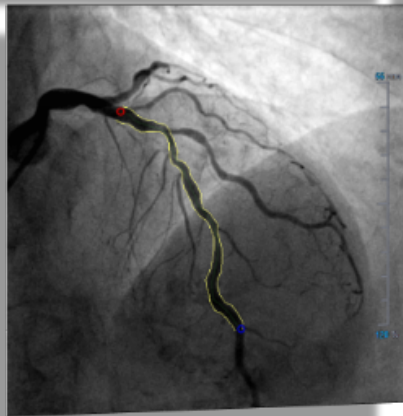

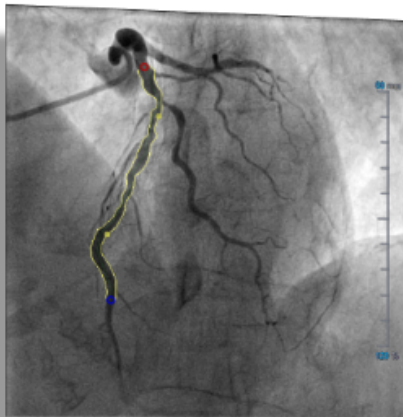

Very poor utilization of pressure wire based functional stenosis evaluation world-wide with few exceptions

# FFR Limitations

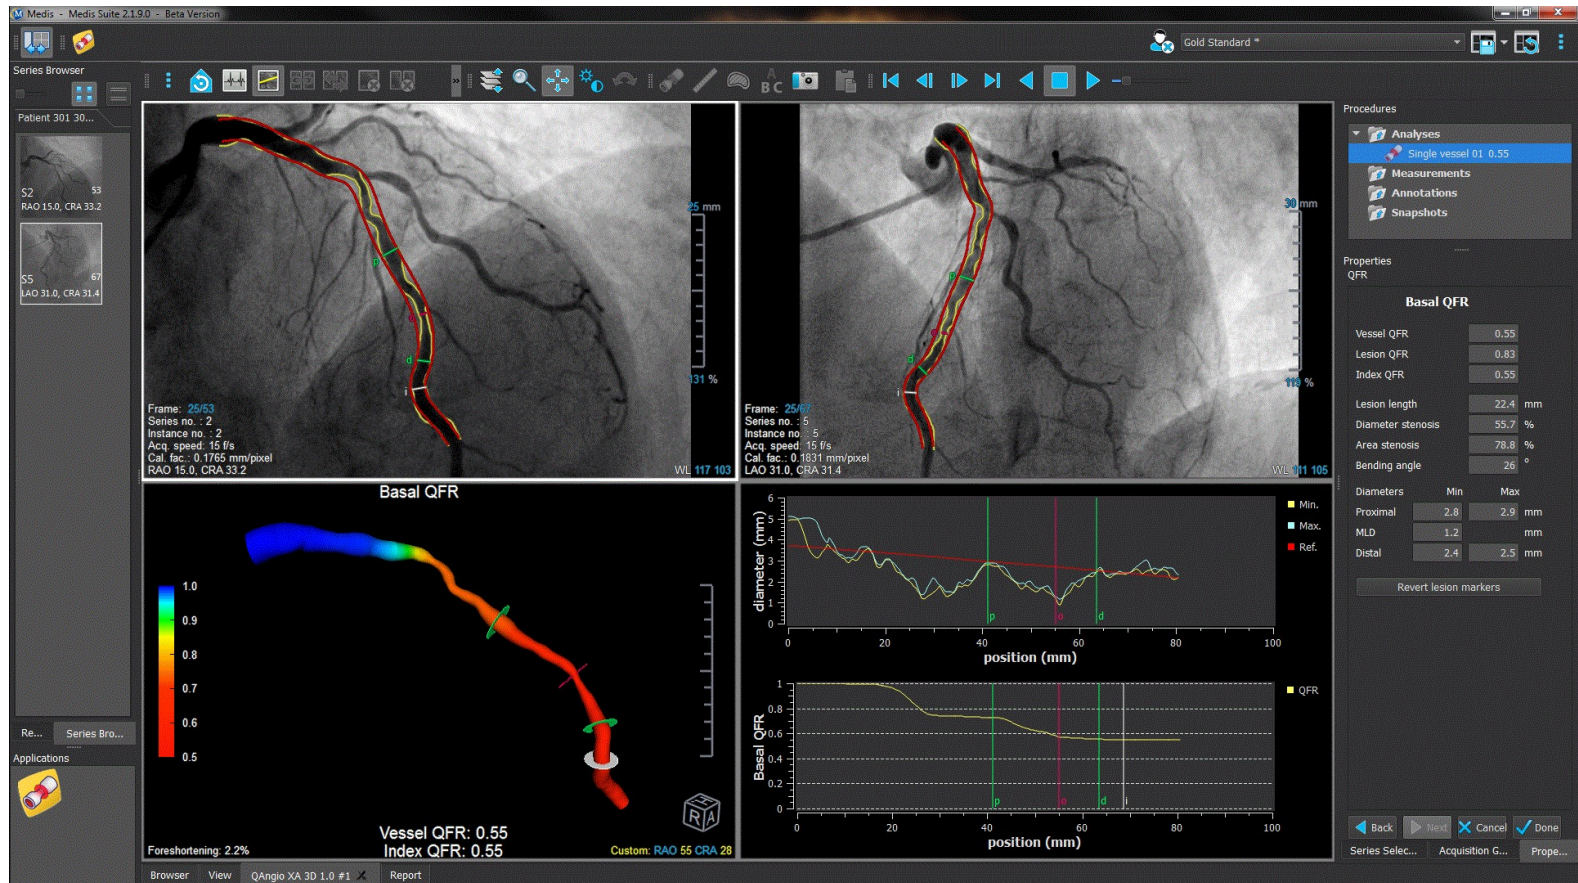

- Invasive
- Need for adenosine
- Time for preparation (consuming)
- Equalization Pressure in the aorta
- Wiring (sometime complex)
- Extubation
- Pullback device not available
- Suboptimal FFR measurements occur in about 1/3 of tracings; JACC Interv 2017; 10:1392
- Expensive for operator or hospital
- Derivation
- Adenosine AV Block
- Worldwide acceptance 7-10%

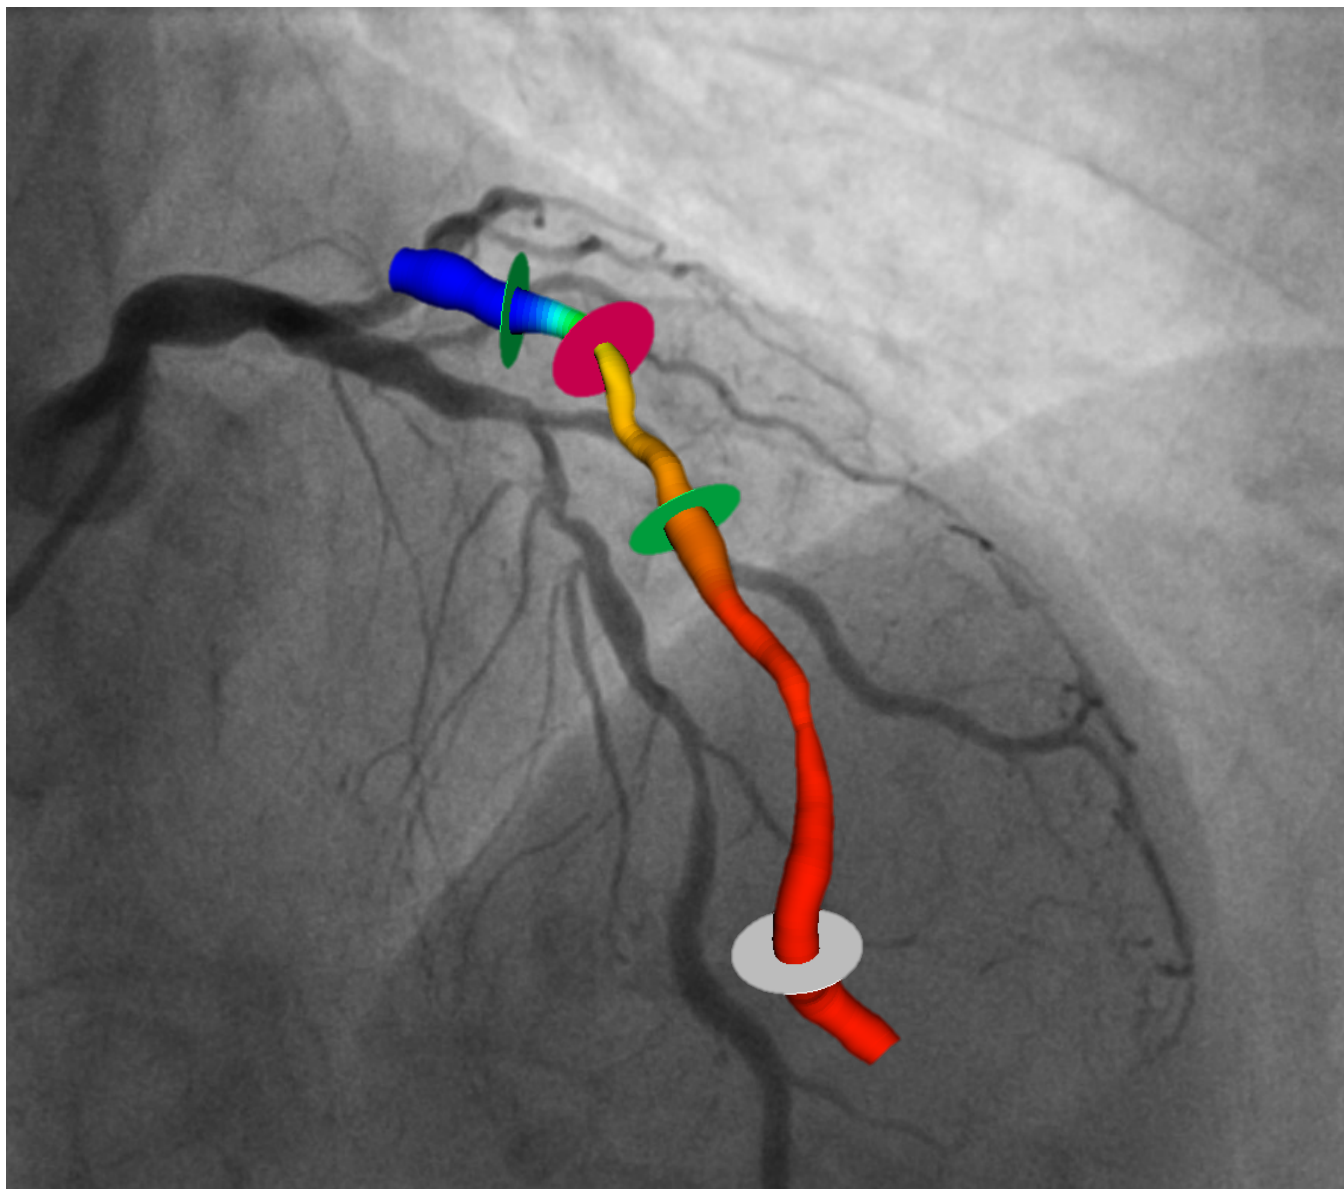

# What if there was another way.....

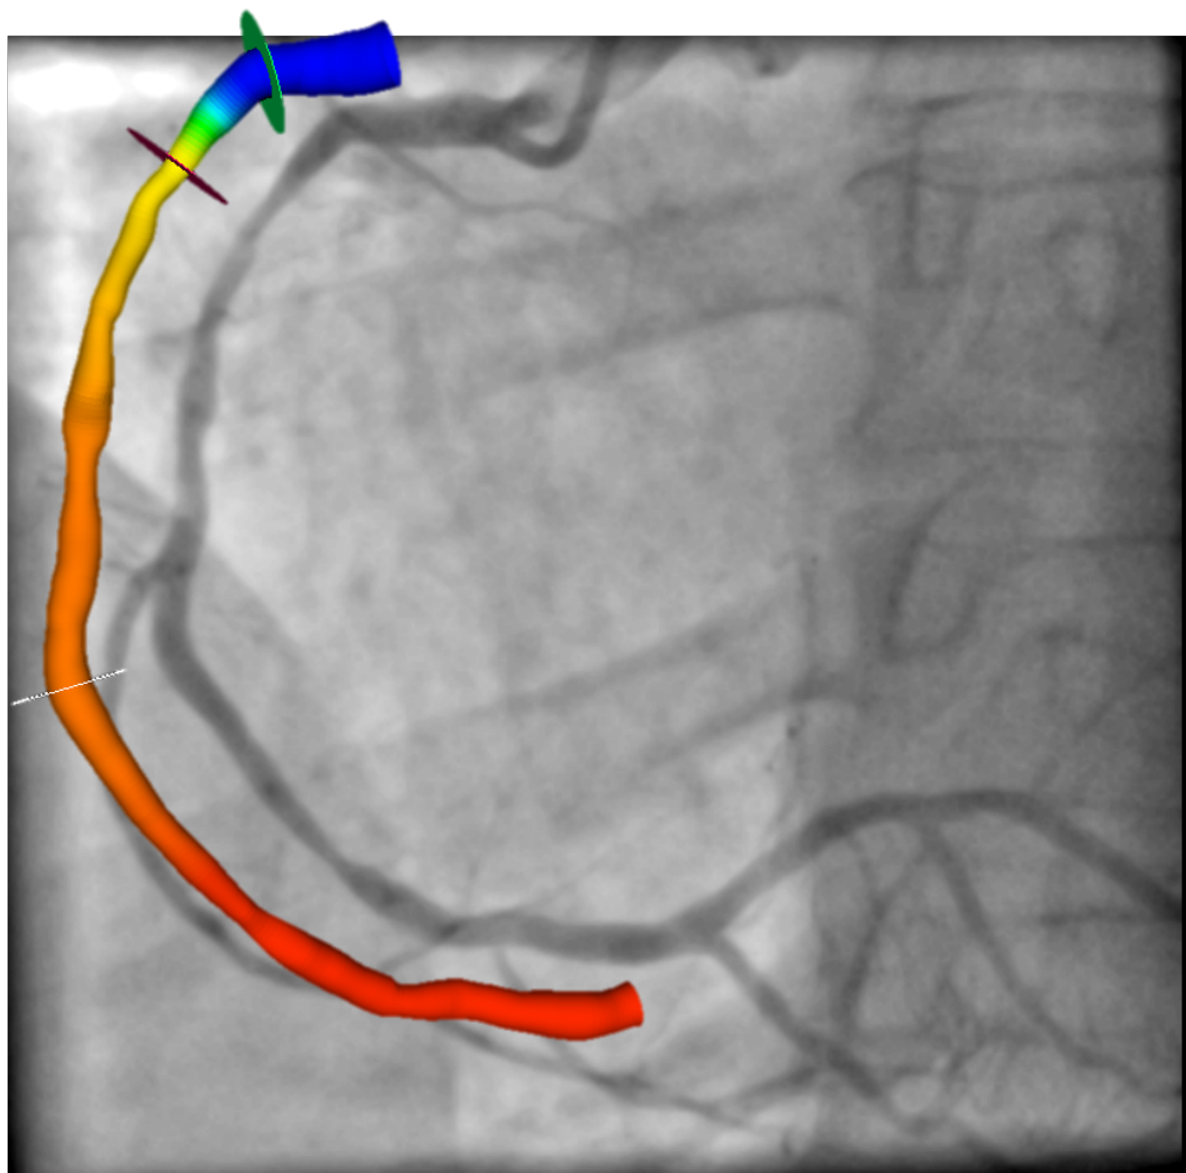

# What if there was another way.....

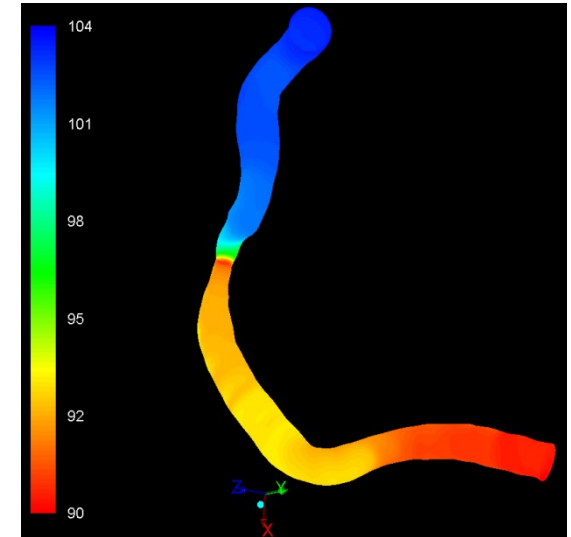

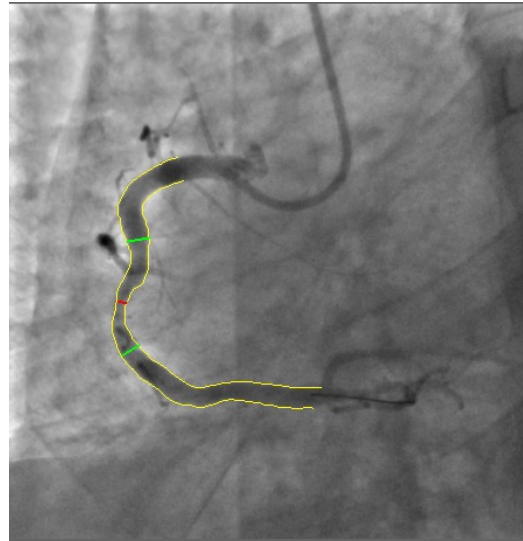

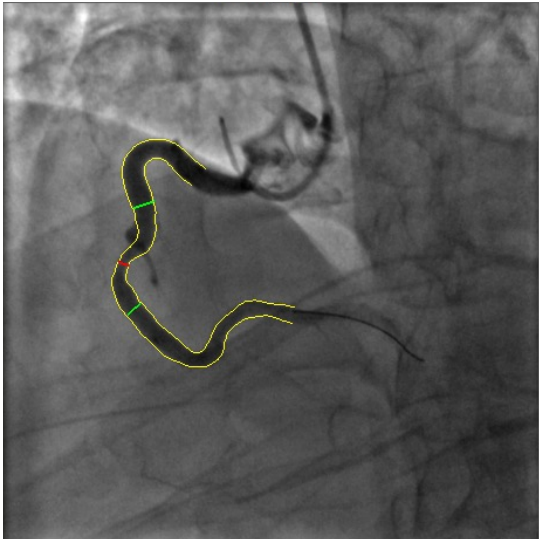

3D QCA model, color coded with the QFR values, as assessed by QAngio XA 3D 1.0 (Medis, Leiden, The Netherlands)

# QFR

(Quantitative Flow Ratio = Medis' QCA derived FFR)

**3D model** reconstructed from 2 angiographic projections with angles  $\geq 25^\circ$  apart, acquired by monoplane or biplane systems.

QFR = 0.87

Patient-specific **volumetric flow rate** (at hyperaemia) calculated using the combination of contrast bolus front **frame count** and **3D QCA**;

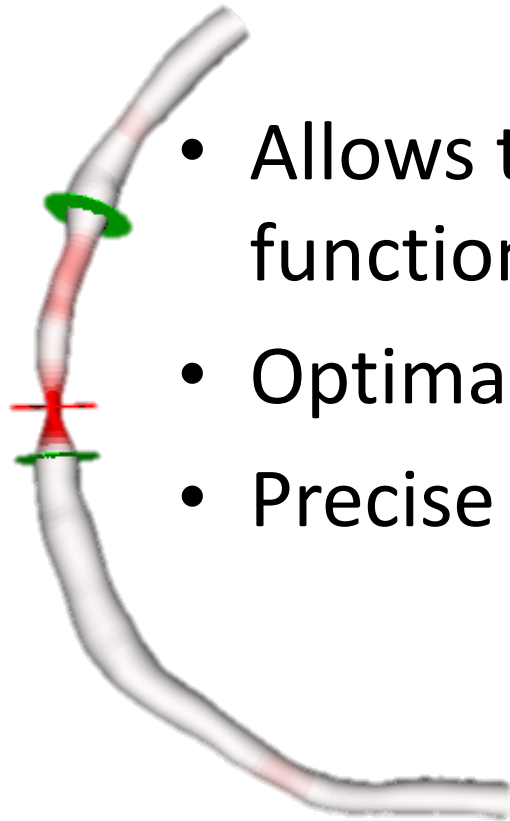

FFR = 0.85

**In-procedure time: < 5 min**

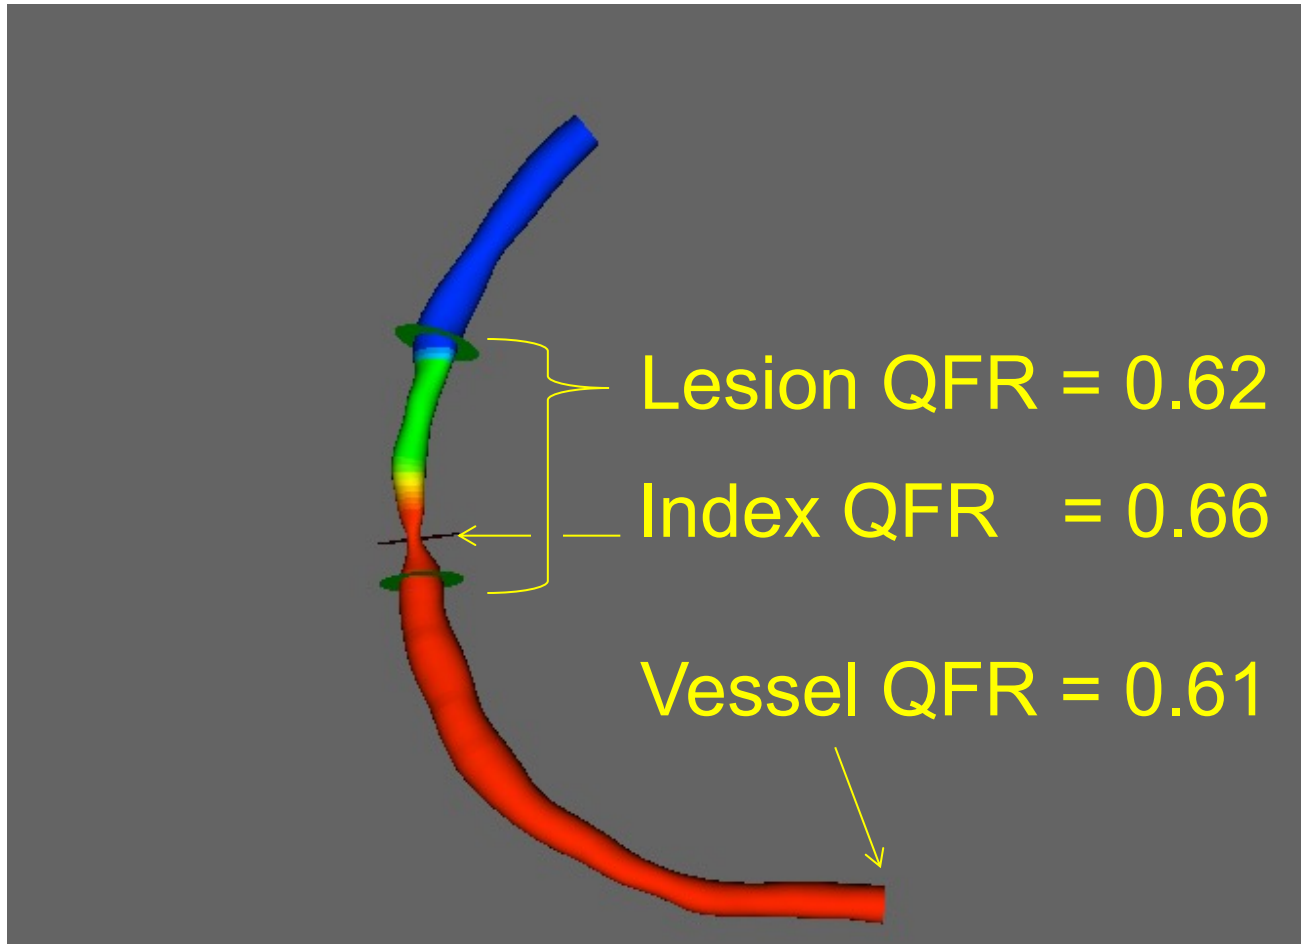

# 3D QCA

3D vessel modelling by Qangio XA 3D is the backbone for the PCI procedure:

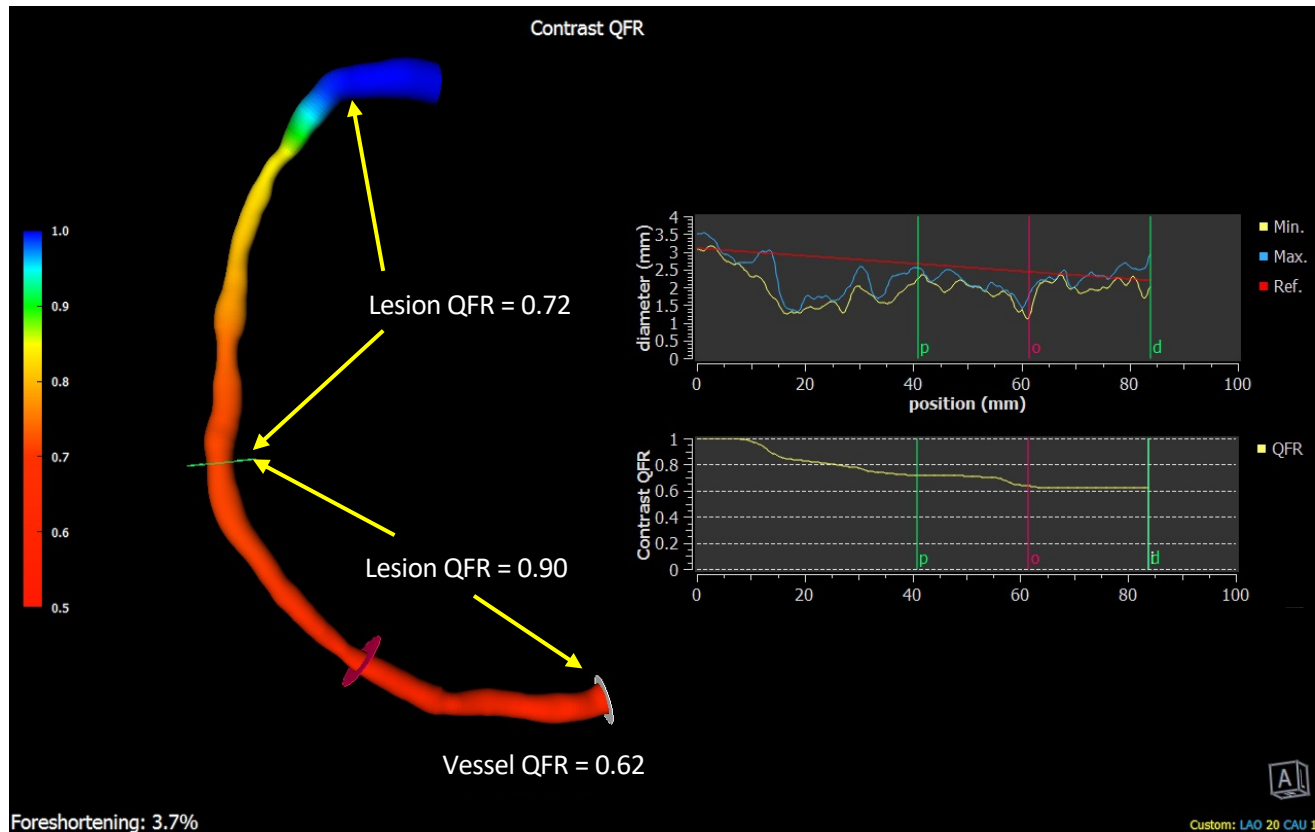

- Allows the calculation of the functional significance parameter QFR
- Optimal viewing angle for PCI
- Precise stent sizing

# QFR (Medis' QCA derived FFR)

# Several QFR parameters

QFR pullback curve  
synchronized with  
diameter curve

- Vessel QFR = QFR value at distal vessel segment location
- Lesion QFR = significance of that lesion only
- Residual vessel QFR = significance of all other parts of the target vessel  
(in case of the first lesion (lesion QFR = 0.72; residual QFR is 0.90))

# First Clinical Trial

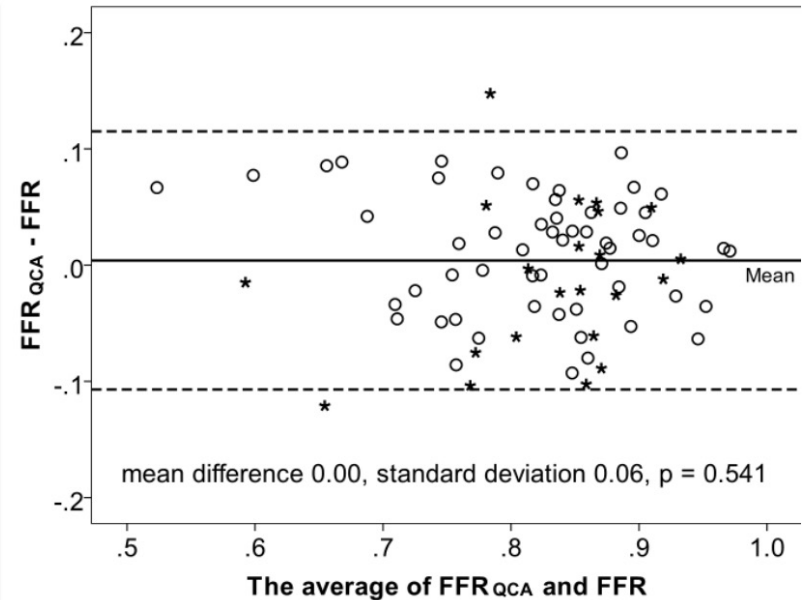

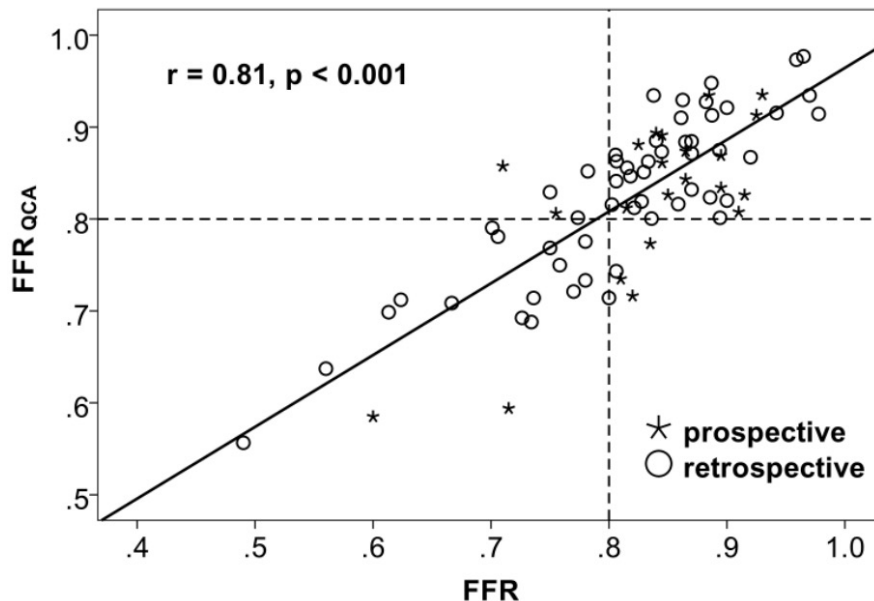

2014

### EDITORIAL COMMENT

### Fractional Flow Reserve From 3-Dimensional Quantitative Coronary Angiography

**Fresh Light Through an Old Window\***

Alexandra J. Lansky, MD, Cody Pietras, BSc

*New Haven, Connecticut*

In this issue of *JACC: Cardiovascular Interventions*, Tu et al. (1) report on an initial validation study for a less-invasive approach to derive fractional flow reserve (FFR) based on the coronary angiogram. The investigators should be congratulated on developing an innovative means to expand the diagnostic value of angiography by including physiological ischemic assessment, potentially broadening access FFR data to every patient undergoing cardiac catheterization.

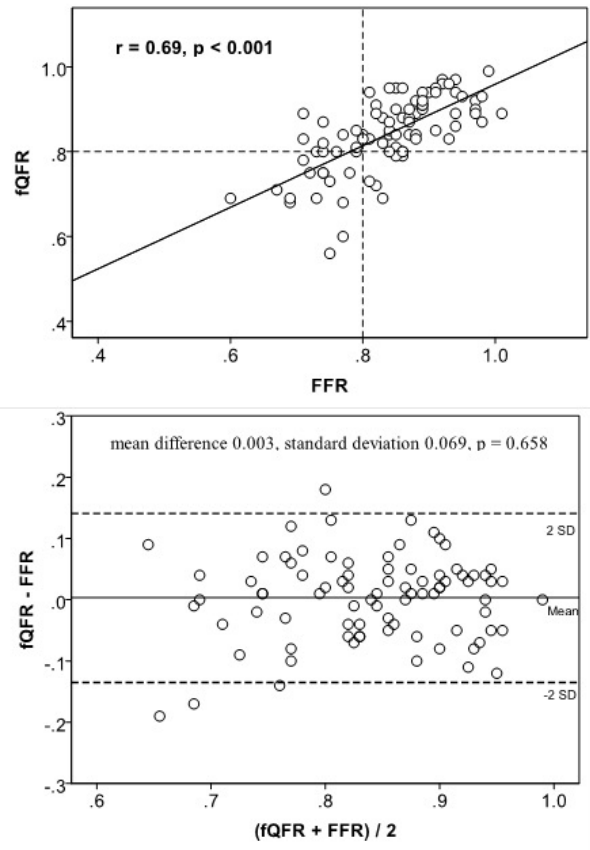

## FAVOR II

- Finalized recruitment and analyses of 73 patients in multi-center setting for optimizing algorithms;
- Tested 3 different scenarios:
  - 1) with adenosine;
  - 2) without adenosine; and
  - 3) fixed flow velocity.
- Manuscript submitted to JACC Interventions

**FAVOR II confirmed results of FAVOR I**

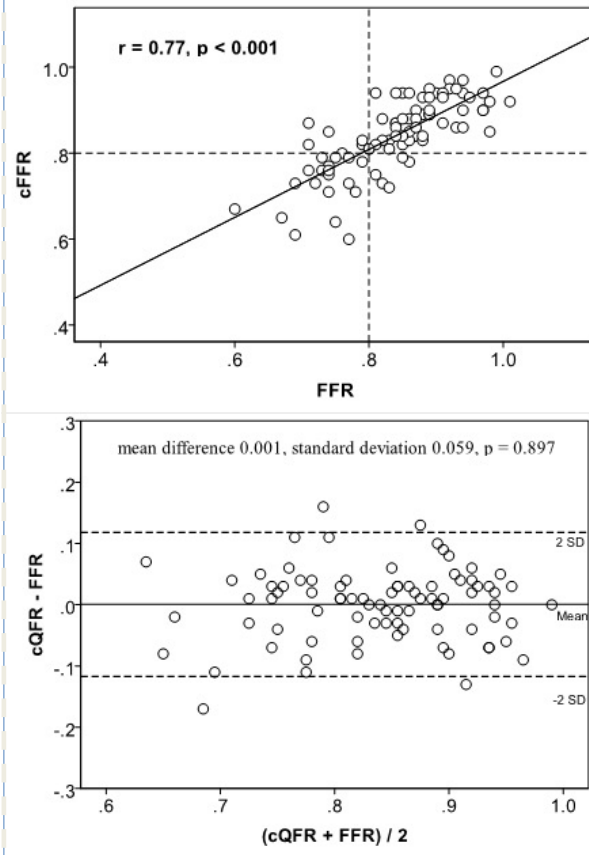

# Results – Correlation and Agreement

# How does it integrate into my practice ?

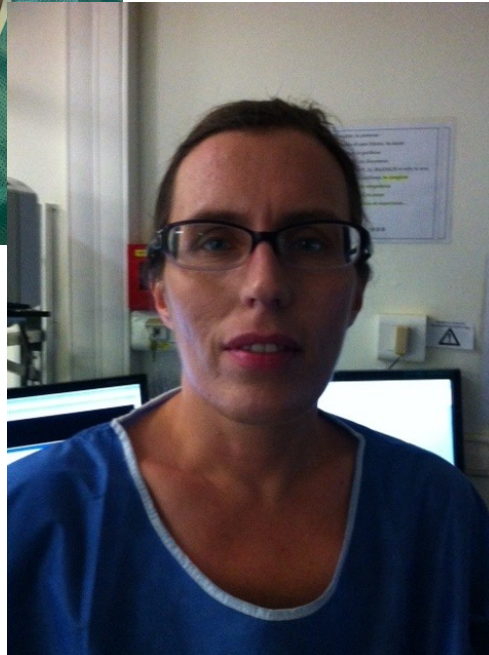

Examination Room

Control Room

- Images are automatically pushed by GE X-ray system to the Medis Suite workstation, for optimal work flow during examination
- Viewing angles are pushed as well for optimal and fast selection of good second view of target vessel
- Analysis performed in the control room
- Result can be displayed in the cathlab on the Large Display Monitor (LDM)

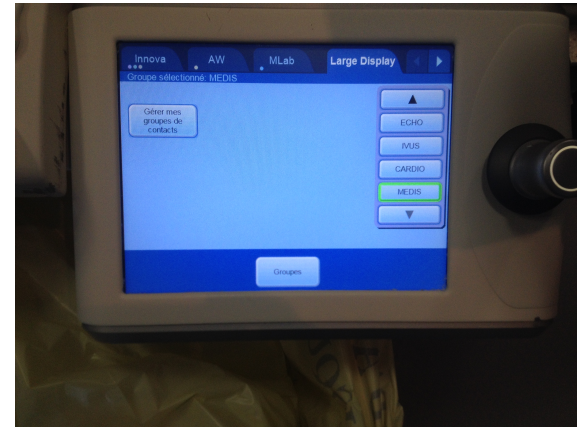

# Who is working behind the screen?

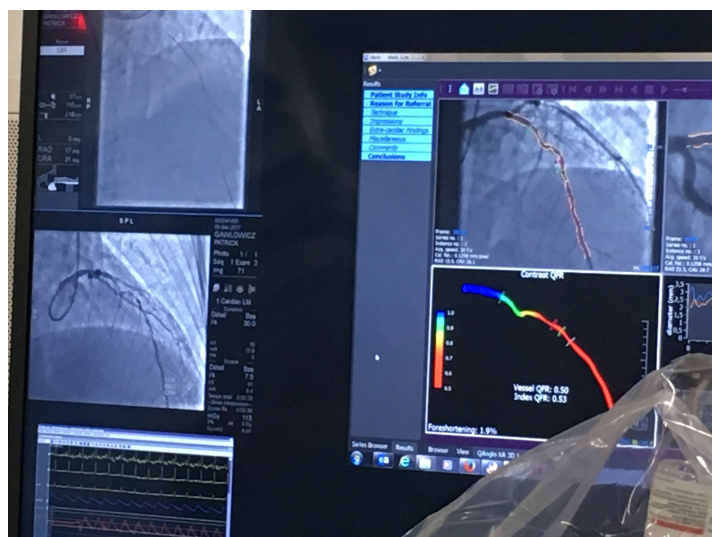

**MY STARS**

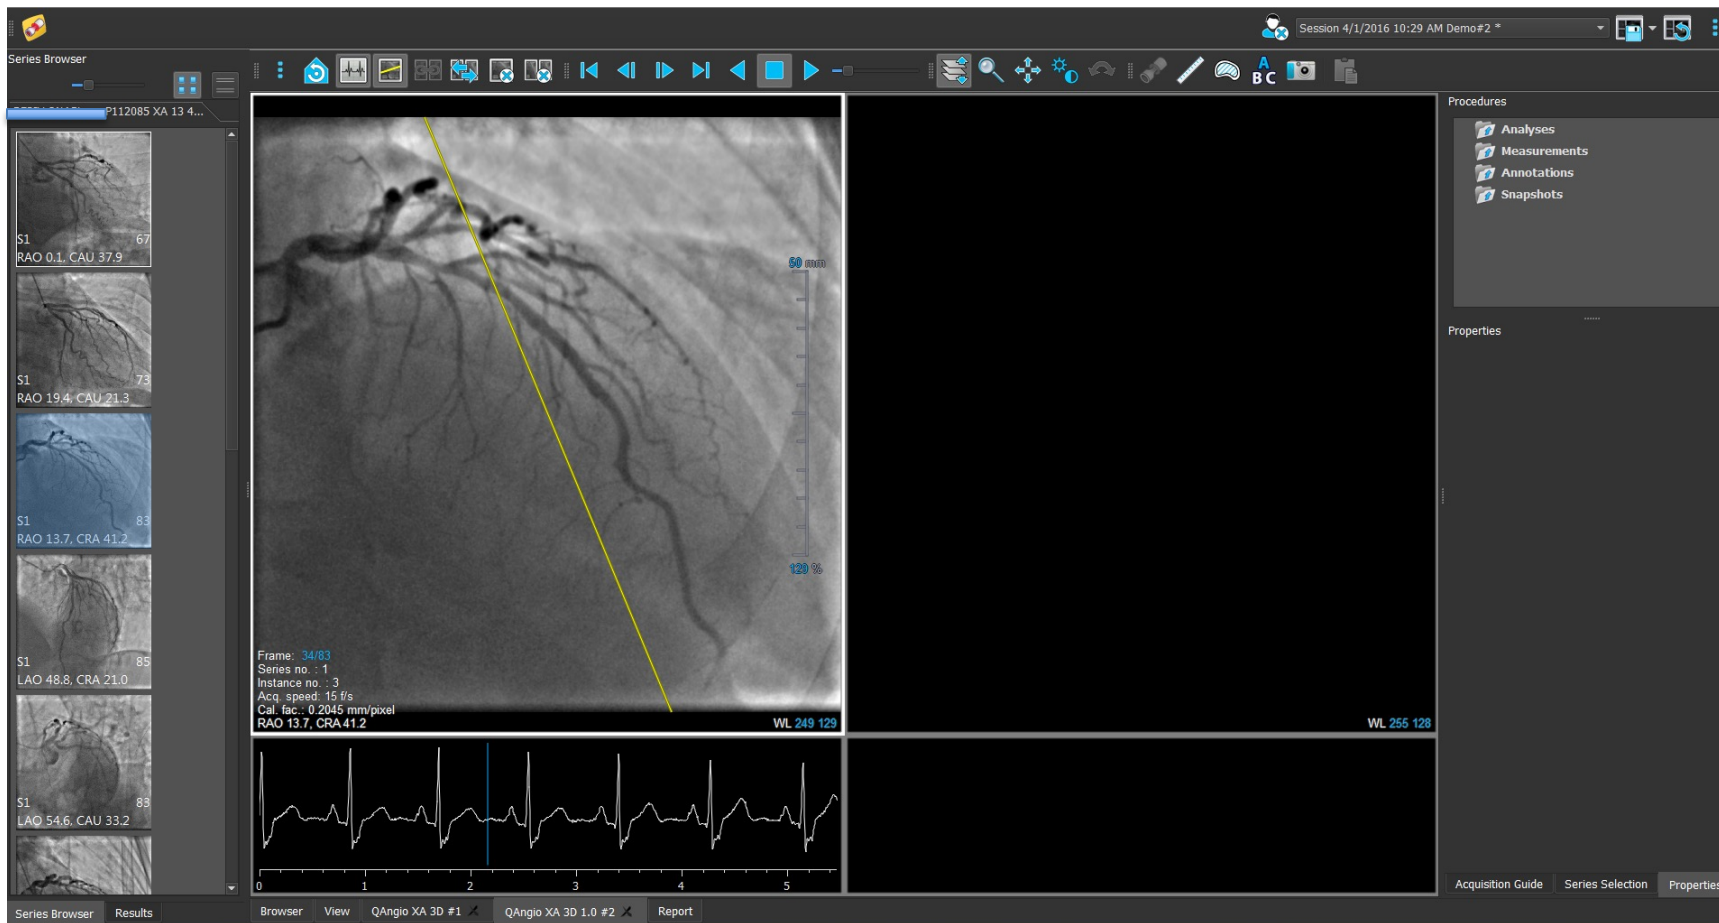

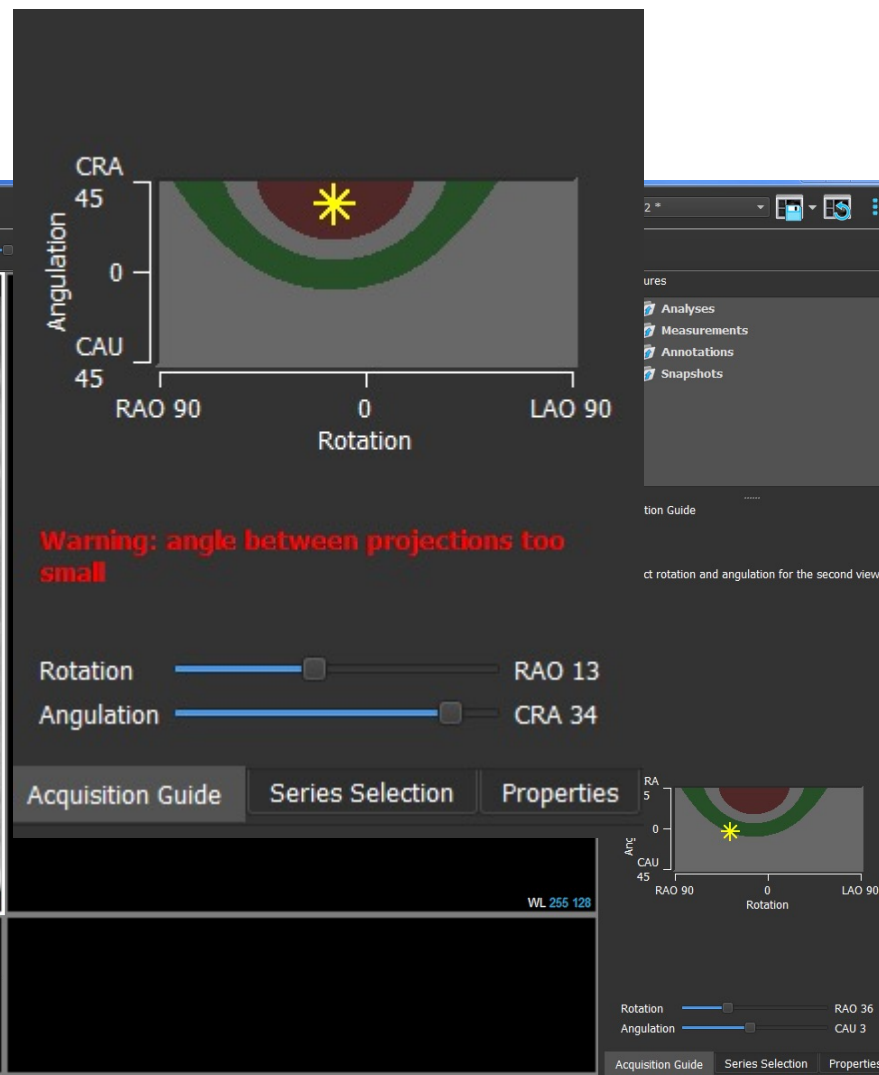

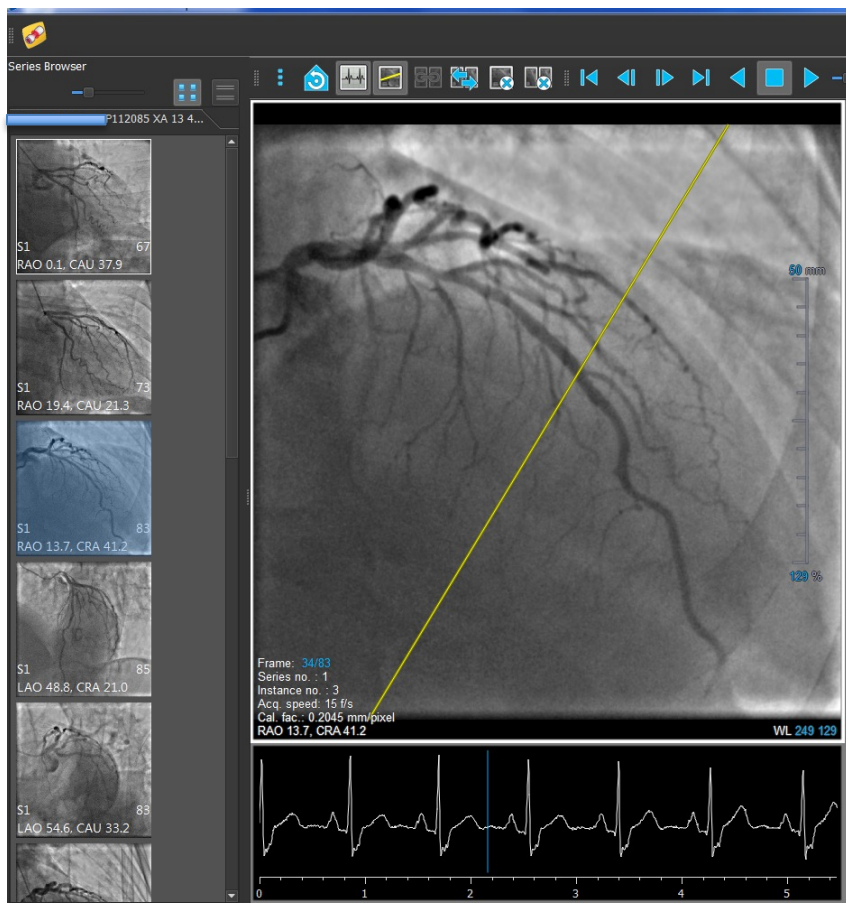

# Special options for Medis connection for the LDM

# Benefits

- For patients:
  - No adenosine with side-effects
  - No extra radiation
  - Less chances on complications due to wire insertion
- For (interventional) cardiologist:
  - Applicable in diagnostic cases, and pre-, during-, and post-PCI
  - Applicable in all coronary vessels without repeat insertions of wire
  - Fast and easy, embedded in diagnostic on-line workflow
- For hospitals:
  - Cost-effective

# Tips and Tricks

Do not forget Nitro

PA > 100 mm Hg

Get good pictures,

increase frequency if needed

5F

Avoid superposition

Look at the curves

Ostial lesion
